

BEFORE THE
RESTORATION ADVISORY BOARD

In re: NAS JRB/ARS WILLOW GROVE

A meeting was held before Loretta B.
Devery, Registered Professional Reporter and Notary
Public, at Willow Grove Naval Air Station, Willow
Grove, Pennsylvania, on Wednesday, January 14, 1998,
commencing at 6:00 P.M.

PRESENT:

JIM EDMOND
CDR. TERRAY WOOD
LT. CDR. LE MASTER
COL. RICHARD MOSS
MAJ. MARGE McGLINN
RUSSELL TURNER
JAMES COLTER
DREW MARCOTTE
PAUL GRECO
DEBBIE FELTON
JULIE WIDMAN
KEN TYSON
MARY "LIZ" GEMMILL
ERIC LINDHULT
BARBARA CURTIS
RICHARD PEFFALL
TED ROTH
THOMAS HIBBS
JIM VETRINI

RAY LEOPOLD
JACK DUNLEAVY
PAM REIGH
CHRISTY HUGHES
TOM FRIEDMAN
DANIEL McCAFFREY
DARIUS OSTRAUSKAS
TIM SHEEHAN

ALL POINTS REPORTING
723 Erlen Road
Norristown, PA 19401
(610) 272-6731

COPY

1 ---

2 MR. EDMOND: If we can bring the
3 meeting to order. I'd like to welcome everyone to
4 the first meeting of 1998 Naval Air Station
5 Restoration Advisory Board, Willow Grove. For the
6 first order of business, I'd like to introduce the
7 new military co-chair, Commander Terray Fox. He's
8 our new Executive Officer. He's also the new --

9 CDR. WOOD: Terray Wood.

10 MR. EDMOND: Terray Wood, I'm sorry.
11 But Terray Wood. And he's the new Executive Officer
12 and he'll be the new co-chairperson for the next two
13 or three years.

14 Also, I'd like to ask the RAB members
15 that are here, did everyone receive their Community
16 Relation Plan?

17 RAB MEMBERS: Yes.

18 MR. EDMOND: Then we'll get right on to
19 business. The Air Force will give the first
20 presentation. It will be update on their
21 remediation actions since the last RAB meeting in
22 September.

23 MS. WIDMAN: And now that you've got
24 that all set up, we need to do the overhead.

1 Basically, what I wanted to do tonight
2 was just give a brief synopsis of where we are with
3 the investigation of the washrack. Whoever packed
4 my folder didn't pack the right overheads, so we'll
5 just work with this one.

6 Just to refresh your memory as to why
7 we're out at the washrack in the first place,
8 someplace that's a little old. We had several
9 objectives for the work we did out there. One, we
10 wanted to find out if the washrack for the washrack
11 area and the trickling filter were a source of the
12 concentrations of VOCs we see in ground water in
13 that area.

14 Another objective was to find out if
15 the washrack area could be a source of the VOCs that
16 are seen in the Privet Road monitoring wells and in
17 the Navy supply wells.

18 And the third objective was to see if
19 maybe there was another source in that area that
20 could be contributing VOCs, you know, to the ground
21 water beneath the washrack.

22 So in a nutshell, we're looking for the
23 source of VOCs that are in the ground water beneath
24 and downgradient of the washrack.

1 In order to do that, we performed a
2 field investigation that started in November, and
3 actually we just completed yesterday, and that
4 investigation had two components. One was to
5 investigate the soils themselves that remain in the
6 area of the washrack where the former trickling
7 filter and piping are; and the other component was
8 to investigate ground water conditions.

9 What we did in terms of the soils, we
10 did 10 soil borings. Those borings themselves were
11 performed where the trickling filter was before,
12 beneath the former piping, and in the area of the
13 buildings. A sample was collected from each of
14 those borings, submitted to the lab, and it's being
15 analyzed for volatile organic compounds,
16 semi-volatile organics and TPH. So those soil
17 samples are all off at the lab seeing what's
18 happening to them.

19 We did quite a bit more work involving
20 the ground water in that area. We installed
21 monitoring wells in three different locations. We
22 put one well downgradient of the washrack, we paired
23 it up with an existing well, and that was a deeper
24 well. It's an intermediate depth well. We put a

1 well between the washrack and the Privet Road
2 Landfill to see what concentrations were in that
3 area. And we also put a well cluster, meaning an
4 intermediate depth well and a water table well off
5 to the west of the landfill to see if in fact there
6 could be another source in that direction.

7 We did more or less a step-by-step
8 approach to installing the wells to find out as much
9 as we could from the bore holes before we actually
10 put a well in them. And what we did was we did a
11 bunch of down-hole geophysics. We ran several
12 different tools to tell us different things. And we
13 ran down-hole video, which if I can get the
14 audio/visual equipment to work well, I'll try to
15 show you some of them that? We also did vertical
16 flow meter work to see how ground water was flowing
17 within the bore holes, meaning up or down.

18 And then finally, we did packer
19 testing. And what packer testing is is you take and
20 seal off an interval in the bore hole. It has
21 rubber packers that essentially isolate an interval
22 in the bore hole. And then you can pump water from
23 that and sample it. And what that can tell you is
24 what the concentrations are in that fracture that

1 you've isolated. And you can see if the
2 concentrations are different than fractures that are
3 above that or below it. It's a good way to
4 vertically profile what contaminant concentrations
5 are as you move downward without having to put a
6 whole bunch of wells to do it.

7 And after we did all those things, we
8 went in and put the monitoring wells in. And then
9 just last week and this week, we sampled them. And
10 we sampled all the existing wells at the washrack,
11 our new wells, and the existing wells at Privet Road
12 Landfill. So those samples just went in. They're
13 being analyzed for volatiles and semi-volatiles
14 similar to the soil and also for dissolved metals.

15 I can't tell you anything exciting
16 about what all of this means, because if you haven't
17 gotten the idea, you'll get it soon, it's all just a
18 pile of data at this point. And we're also waiting
19 for a bunch of laboratory results. So essentially,
20 where we are is at the completion of the field
21 investigation stage and now we'll get into the data
22 analysis and the report writing and figure out if we
23 can, you know, satisfy our objective of figuring
24 out what the source of the contaminants in the

1 area of the washrack is.

2 Now I want to switch over to the VCR.
3 See if we can do this. This may be a little bit
4 jerky once I get it started. Actually this is
5 probably better than my video, but I haven't turned
6 it on yet. I wanted to explain for a minute what
7 you're going to be seeing.

8 When we do down-hole TV, we essentially
9 lower a television or video camera into the bore
10 hole on a cable and just lower it progressively down
11 through the hole and it takes a picture of what it
12 sees. It sees it really from two angles when you
13 use the kind of camera that we had. You see
14 actually straight down and around the sides or it
15 flips to the side view. By doing this, I think we
16 get probably what is the best visual representation
17 of what the rocks look like down there that you
18 possibly can get.

19 If you're familiar with conventional
20 coring where we pull rock out of the hole and look
21 at it, that's good, but you're left to reconstruct
22 it once it's on the ground. With the down-hole
23 video, we actually can see what it looks like in
24 place.

1 And the bore hole I've chosen is a real
2 good one for this because we can actually see the
3 fractures in the rock where the ground water is
4 moving through them. So if you've ever really
5 wondered what water flow looks like at depth under
6 the ground, this is what it's going to look like.

7 Now, I'm not sure how clear this is
8 going to be, but we'll give it a shot and see if it
9 works. This is Building 320. I'm hesitant to fast
10 forward this because we'll be in the bore hole in a
11 second. Right now you're inside a surface casing
12 moving downward. Okay, this is -- and then you hit
13 the water right there. The numbers in the middle
14 are the depth below the ground surface. And at this
15 point you're not seeing rock, you're seeing casing.

16 MR. EDMOND: Feet or meters on that?

17 MS. WIDMAN: That's feet, I'm sorry.
18 We just went into the rock. And you can see some
19 vertical fractures there on the lower left. Now, it
20 flipped to side view so we can get a better look at
21 what those fractures appear to be. The black thing
22 that is strategically in the wrong place is the
23 strut on the camera. But what you're looking at
24 there is a side view of the vertical fracture we

1 just before that saw in plan view. And what he's
2 doing is moving down that fracture, meaning the
3 camera operator, looking at it. That's a pretty
4 nice hole right there. The white cement you -- the
5 white stuff you see there is actually cement
6 infilling some of the fractures.

7 Now, at this point the bore hole has
8 gotten much smoother. So you're out of one of the
9 fracture zones. And this is what the bulk of the
10 rock looks like down there. The common
11 understanding of the Stockton formation, which is
12 the bedrock underlying the Naval Air Station and the
13 Air Reserve Station, is that most of the water flows
14 through fractures. And when you see how smooth that
15 bore wall hole is and then when you see where the
16 holes are, it makes sense that, yes, that probably
17 only water does move through the fractures, it
18 doesn't move between the individual grains in the
19 rock.

20 MR. ROTH: Any information on who or
21 when that cementing was performed?

22 MS. WIDMAN: It's just natural
23 precipitation of silica from the ground water moving
24 through the fractures at one time.

1 I'm to go ahead and fast forward this
2 down to some interesting intervals. I guess anybody
3 who wants to hang around afterwards, we can look at
4 this in more detail, but I realize most of you
5 aren't geologists, so you don't probably get as
6 excited by this as some of us do.

7 Once we get down around 50 feet, you'll
8 start seeing some of the more fractured intervals we
9 have here. What you're seeing in this view is just
10 one of those sealed or at least partially sealed
11 fractures. And there were a lot of them in there.
12 For the geologists, there's some nice structures in
13 here, sedimentary structures. You know, it's just
14 as valuable as looking at core, you can really see a
15 lot.

16 You see there are particles that you
17 can see sometimes, that stuff floating in the water,
18 sediment. On the sides of the bore hole, you can
19 see those narrow fractures that are really sealed,
20 you know, by that natural cement. Water's not
21 moving through those probably. Some nice cross-
22 bedding, which is original structure on the
23 sandstone, for the geologists in the crowd, and some
24 slum features.

1 The side view camera actually is about
2 a foot -- the number there is about a foot too deep.
3 So when you're 48 down, it's saying 49. It's just
4 the difference in positioning of the lens on the
5 camera as it moves down.

6 We're going to start moving into some
7 of the areas that were very heavily fractured. And
8 I believe it's real close here where we start
9 traveling down one single vertical fracture.

10 MR. TURNER: You leave the bore hole?

11 MS. WIDMAN: No. The thing is just
12 running. He's just lowering a cable down the hole.
13 More silica cement. And the beginnings of the
14 fractured areas should be coming right up.

15 There on the left-hand side, you can't
16 really see it that well in this picture, there's a
17 vertical fracture opening up and we should shoot
18 right into it about now.

19 It's a nice hole where you can actually
20 see water flowing into the bore hole out of that
21 actual horizontal fracture. It's one of the best
22 views of flowing ground water I've ever seen. We're
23 very prominent in the fractures here. Some of them
24 have cement in them, some of them don't. By cement,

1 I mean the white you see.

2 Another opening where water is coming
3 in. The black holes are essentially pretty big
4 fractures, relatively speaking. I couldn't tell you
5 exactly how big, you know, they are except I can
6 tell you that camera strut you see to the left is a
7 couple inches wide. So this is one of the intervals
8 we packer tested. You know, we sealed packers above
9 and below these fractures and took water samples to
10 see what kinds of concentrations were in that water.

11 And this whole zone from around 50 to I
12 think it was about 66 feet had a lot of fractures in
13 it and you're seeing some of the best of them here.

14 MS. CURTIS: How wide is the bore hole?

15 MS. WIDMAN: The bore hole is eight
16 inches in diameter. And this has really been almost
17 one continuous vertical fracture. I mean if you
18 spun around the camera so you can see the horizontal
19 ones that intersect it, but that's been pretty much
20 continuous vertically for since up around 40 some
21 feet. You can continue to see the vertical
22 fracturing to the lower right. If you see particles
23 moving upward in the bore hole, I don't know how far
24 away that can be seen, that's because there are

1 upward gradients in this bore hole and their water
2 is flowing up, even though the heavier particles are
3 sinking down.

4 Another nice vertical fracture,
5 horizontal fracture.

6 MR. ROTH: Have these particles been
7 dislodged by the camera?

8 MS. WIDMAN: Possibly. The hole has --
9 the bore hole has silt in it because of the drilling
10 process and because it was disturbed. Before we ran
11 the camera, we did let the bore hole sit at least
12 overnight to let, you know, the finer grains settle
13 out. But, you know, there's still some silt in
14 there.

15 I think that's actually the end of the
16 exciting stuff. I just wanted to give you a chance
17 to see what it really looks like down there.

18 MR. EDMOND: Okay, Julie, thank you
19 very much. That was really interesting. That was
20 great.

21 MS. WIDMAN: If anybody wants to see it
22 afterwards, I'll play it again.

23 MR. EDMOND: We're going to move on to
24 the Navy Phase II.

1 MR. TYSON: We just have one more for
2 the Air Force.

3 MR. EDMOND: Okay. I'm sorry.

4 MR. TYSON: Well, I don't have any
5 down-hole camera video to show you, but I am going
6 to bring you up to date on the activities that have
7 been taking place out at the POL area. Since the
8 last RAB meeting, just to refresh your memory, we
9 are in the process of moving forward with a pilot
10 study at this time to address residual jet fuel
11 product, which is believed to be the source of
12 hydrocarbons in ground water in that area of the
13 site.

14 Prior to the last RAB meeting, we had
15 completed a number of activities. The pilot study
16 work plan was finalized in August of 1997. The
17 pilot study work plan for a combination soil vapor
18 extraction/ground water extraction pilot study to be
19 conducted out at the site.

20 On August 25th, 1997, we completed
21 24-hour ground water extraction/soil vapor
22 extraction performance tests, and that was recorded
23 in the following month of September. The results of
24 that test indicated the need for somewhat more

1 extensive six-day soil vapor extraction/ground water
2 extraction performance test, which we recently
3 completed.

4 We went into October doing the
5 contractual modifications to implement the test. A
6 no-cost contract modification for the six-day
7 performance test was completed in October. We
8 completed the work plan for the six-day performance
9 test in November of 1997. And then in December of
10 1997, just before Christmas, we implemented the
11 performance test.

12 And I can tell you from personal
13 experience that this is a continuous test, run 24
4 hours a day, and I can tell you from personal
14 experience that Willow Grove Air Reserve Station is
15 a mighty lonely place about 3:00 in the morning when
16 you're doing a test like this.

17
18 We have just completed the draft report
19 on the test, it was submitted last week, and it is
20 undergoing review at this time. We expect about a
21 three-week review period for that report. And then
22 once that report is reviewed and complete, it is
23 anticipated at this time that we will move forward
24 with the pilot study per se, which will include the

1 installation of -- well, a total installation of
2 five recovery wells, three of which will be -- I'm
3 sorry, two of which will be retrofits of existing
4 wells and three will be new recovery wells. And we
5 anticipate that activity to be in mid February or
6 so.

7 The actual pilot system construction
8 will commence in late February or early March. And
9 we expect to have the system up and running by
10 sometime mid March to late March. So that's the
11 time frame, that's what we've completed thus far,
12 and we expect to be moving forward from this point.
13 Okay.

14 MR. EDMOND: As I was saying, we'll
15 move on to the Navy's Phase II RI. I know at the
16 last RAB meeting we stated we were going to give you
17 the Phase II RI for review by this time, but because
18 of the depth -- this is the Phase II RI right here,
19 these two volumes, and we're just reviewing it now
20 ourselves. So what we've come up with a solution,
21 we were afraid that if we gave you those two volumes
22 to review, we would not have a Restoration Advisory
23 Board any longer. So we're going to give the RAB
24 members an option. You have a choice of these two

1 volumes here to review or an executive summary to
2 review. I know the Erics and the Jacks will take
3 the two volumes, but I'm not sure who else wants to
4 go through this, or they can review this. So at the
5 end, let me know who wants what and we'll get you a
6 copy in the next few weeks. I think, Jim, how long
7 before we give a copy to the RAB members?

8 MR. COLTER: We're shooting for mid
9 March.

10 MR. EDMOND: Mid March. Mid March
11 we'll get you a copy for your review. But like I
12 said, I was scared we were going to not have a RAB
13 board if I sent everyone those binders.

14 Without any ado, Jim Colter, as you all
15 know, is our Restoration Program Manager, and he'll
16 give us the brief on the Phase II RI.

17 MR. COLTER: That was it. As Jim said,
18 since the last RAB meeting, Brown and Root has been
19 putting together, and this is a rough draft for
20 mainly internal review, and myself and Debbie Felton
21 and Barbara Douglas and Jim and his group have been
22 reviewing this and providing comments. And before
23 we send it out draft with our recommendations,
24 there's certain things, we want to make sure, our

1 recommendations are accurate, and we probably will
2 have some type of technical subcommittee meeting
3 prior or during the review process to make sure that
4 the regulators are on board with our conclusions.

5 The only other thing of interest before
6 I get into the site, I'd just like to make a couple
7 announcements. Mr. Darius Ostrauskas is now our new
8 EPA Region 3 representative, replacing Steve Hirsh.
9 And for those of you who probably don't know, Mr.
10 Dave Kennedy, who was our Pennsylvania DEP rep,
11 passed away last week. So I guess he had an
12 extensive illness. So we'll be having another
13 Pennsylvania DEP rep probably at the next meeting.

14 So other than that, and Jack Dunleavy
15 is the newest RAB member, you'll remember him from
16 being my side kick for a number of years, so looking
17 forward to his expertise.

18 MR. DUNLEAVY: Thanks, Jim.

19 MR. COLTER: The other thing that we're
20 doing concurrently is the Site 10 installation of
21 the free product recovery system. You'll recall we
22 did a two-year pilot study on several methods of
23 product recovery and sent out a document basically
24 to state to the RAB documenting what we'd like to

1 do. That system is installed. We had hoped to have
2 it up and running during October through December
3 time frame, but contractors have some problems with
4 the computer system.

5 MR. EDMOND: Two of the three are
6 running now.

7 MR. COLTER: It is running now?

8 MR. EDMOND: Yes.

9 MR. COLTER: Okay. They put what's
10 called an auto dialer on. And basically it's a
11 simple system just to tell the contractor from a
12 remote location if the system is working or not.
13 They had hoped to have installed a more integral
14 system where you can actually turn pumps on and off,
15 shut valves on and off, but they had some trouble
16 getting that up and going. So we just had them turn
17 on, it's a simple system to get product recovery
18 underway.

19 Concurrently with that effort, the
20 State EPA requested that we do one last round of
21 soil and ground water samples to determine if
22 there's any non-petroleum products at the fuel farm.
23 EA Engineering has given us a rough draft of this
24 report, which we're in the midst also of commenting

1 on. And once we get our comments resolved in this,
2 we'll be sending this out as well for your review.
3 You'll probably be getting this report prior to
4 Phase II. As Jim said earlier, we're shooting for
5 mid March to get that document out. That's about it
6 as far as RI activities.

7 MR. EDMOND: Russ Turner, our
8 contractor from Brown and Root, is going to give us
9 a demonstration on the GIS. It's a computer
10 generated mapping system that puts together maps and
11 photos together so we can better understand, from a
12 remedial point of view, and even for the regulators,
13 to show where our sites are on the base, where the
14 wells are, where the soil samples are taken. And it
15 will all be one format. Instead of having a bunch
16 of reports this size, and we have plenty of those,
17 we'll have one computer disk with all the
18 information on it. Russ and Brown and Root started
19 the operation, and he'll give us a short
20 demonstration on what they've got done so far.

21 MR. DUNLEAVY: Jim, I just have a quick
22 question on the RI. How long will the RAB members
23 have to review the report?

24 MR. COLTER: About a week.

1 MR. DUNLEAVY: A week? Just like old
2 times.

3 MR. COLTER: Probably more along the
4 lines of maybe two months.

5 MR. DUNLEAVY: Two months, okay. And
6 will it be concurrent with the review that the
7 regulators are doing too or have they already been
8 through that?

9 MR. COLTER: It will be concurrent.

10 MR. EDMOND: There's a hand-out here,
11 Russ gave everyone a hand-out. It will give you an
12 idea of what the GIS system does.

13 MR. TURNER: There will be two phases.
14 There's going to be a little talk to see what the
15 film is going to be, then we're going to run a film
16 with the computer. It's pretty high tech, so we'll
17 have some fun with it.

18 I'm hoping that, you know, by the end
19 of this, you'll see what the capability of the
20 system, you'll see why the Navy asked us to put this
21 together. But a couple years ago, when we were
22 working on Phase II RI work plan, etc., the Navy
23 requested that we look at doing some better mapping.
24 And if you turn to page 2, in terms of an

1 overview -- so we looked around and we said what
2 resources were available. And we said, well, there
3 were computer aided design drawings available, there
4 was commercial mapping sources like USGS, U.S.
5 Geologic Service maps, quadrangle maps. There are
6 aerial photographs out there which can be purchased
7 generally commercially, they're available different
8 ways, sometimes on the internet for free. And then
9 what we've been doing over the years, I don't know
10 how many years here, 15 years?

11 MR. EDMOND: Close to it.

12 MR. TURNER: In our RI investigations,
13 we've collected data. And it's put in a database.
14 So after seeing what was available, we proposed we
15 could use maybe some of the latest PC software and
16 prepare a thing called a Geographic Information
17 System. What a GIS is is basically the computer
18 hardware and software that's used to create and
19 combine Information Management System, IMS, in this
20 case, it's an environmental information management
21 system, a geoenvironmental information management
22 system, a lot of words. What it's good for is it's
23 a tool.

24 If we turn to the page with the bullets

1 on it, it provides the Navy with a tool, a way to
2 make sense of the data. It can answer direct
3 questions. You can ask the GIS in soil boring
4 number 1 at Site 1, what's the concentration at what
5 depth. We can ask it general questions like where
6 do concentrations exceed a certain limit, a
7 regulatory limit or something like that. And then
8 the other thing it helps you do is, since our maps
9 are in the same system as our data and our data is
10 three-dimensional because it has depth, we can
11 visualize 3D relationships.

12 For instance, a soil boring sample at
13 certain depth has a concentration. You might want
14 to know what's its proximity to ground water. You
15 can find it by clicking on the soil boring, find the
16 sample you're looking for, and associated with that,
17 it will pop up a menu and pop up a spreadsheet, it
18 will have information about that soil boring and the
19 sample location, like the X and Y coordinates.

20 So my purpose here was to let you know
21 what's coming up here. The film that's coming up is
22 a movie, it's not an online demonstration. It's a
23 demonstration of the GIS. I'm not going to be
24 online querying the database itself because the

1 queries take a long time. So it's a canned
2 demonstration.

3 The advantage, a couple of the good
4 things about the film itself, we can stop it at any
5 time to answer questions. We can go backwards, if
6 we want to, to the beginning. And we can actually
7 skip through different slides at different topics.
8 So just let me know and we can do any of those
9 things.

10 MR. EDMOND: We're also putting our
11 sewer lines on it, our electrical lines. We're
12 going to have a database with not only the IR
13 information, but for the Navy's point of view, we're
14 going to put all our public works information on
15 this same type of database. And everything can be
16 overlaid and used in conjunction with one another.
17 So it has a lot of different uses, not just for the
18 IR program.

19 Tell me when you're ready, Russ.

20 MR. TURNER: I am happy to announce
21 that I'm taking a course in remedial computer
22 operations and I'm going to be employable one of
23 these days once I get my certificate.

24 Okay, we want to find D drive. That's

1 our logo here. Okay, these first series of slides
2 are going to show us how we access information in
3 GIS. The overall, our company in general has been
4 working at numerous locations. What you're looking
5 at is a representation of obviously where the sites
6 in the United States we can work at.

7 Generally on the left are things called
8 themes that can be turned on and off. You can see
9 the United States is turned on now. We're going to
10 try to get the information, we're looking at -- this
11 happens to be Pennsylvania. We're going to zoom in
12 on Pennsylvania. We know it's in Southeast
13 Pennsylvania. We've already asked it to highlight
14 NAS JRB. So now we are looking basically at the
15 USGS map which is imbedded in the GIS system. It's
16 one of, essentially, the layers.

17 If you look at what we call the themes
18 on the left there in the gray, we have turned on CAD
19 drawings, we have turned on buildings, you can see
20 the buildings. And we just now are giving a
21 demonstration of how we can identify features and
22 put tags on them.

23 Within the GIS system, we put in seven
24 aerial photographs. This is the 1995, you can see

1 in the lower left-hand corner. The operator clicked
2 to activate that theme, so that's what you see now.
3 We'll go through here. I'll probably speed this
4 part up because we go through the aerial photographs
5 and sort of show a history. You might notice,
6 because it actually works, as we proceed to the
7 past, you'll actually be able to see how the
8 development, there will be more farms, look like
9 farms around the facility. And then the final
10 aerial photograph in 1948, you'll see the runway
11 doesn't even look like it does right now. It was
12 much shorter, it was basically only the lower end.

13 This is Building 1 I think right there.
14 Is that about right? We just turned on the aerial
15 photograph for 1962. You can see some people were
16 here when we had a discussion about the little
17 investigation of Tinius Olson, that's this facility
18 right here, sort of built into the air station.

19 You'll notice -- I think the important
20 thing to notice here, there's significant aircraft
21 parking facility here in the Air Force end. I think
22 this is also hard concrete parking here for the
23 Navy. All that disappears in later photographs of
24 course.

1 One of the things this demonstrates is
2 the layered nature of the GIS system. One of the
3 things we might use this layered nature for later,
4 we're going to demonstrate it actually, is we can
5 find out where our sites are first of all in an
6 actual photograph, and we can look at where the
7 samples were taken on the aerial photographs. And
8 then the next thing we'll end up doing, we'll end up
9 querying the system to find out concentration of the
10 compound above some sort of a limit which will be
11 actually be for PCBs at Site 1, Privet Road
12 compound.

13 MR. EDMOND: You can see where the new
14 runway is being extended to the old runway, the
15 black compared to the white.

16 MR. TURNER: What year is this? 1956,
17 yeah. So this is -- and you also notice, you know,
18 look at the farms, you know, I think this is all
19 houses in the later ones. Over here, I think we
20 have some industrial parks in 1995, this is 1956.

21 MR. EDMOND: That's where the country
22 club is too.

23 MR. TURNER: Here's the last aerial
24 photograph, you can just see that essentially most

1 of the Air Force -- oh, by the way, these buildings
2 are still turned on because we never clicked them
3 off over here in the themes. However, the buildings
4 didn't exist in 1946. It's a different layer that's
5 showing through. I can't control that. That's,
6 like I said, this is a film clip or a movie more
7 than an online demonstration. I would go over and
8 click those off to see which buildings existed. But
9 here you can see the rural nature around and how
10 short the runway was in 1946.

11 The next series of slides we're going
12 to show some of the capabilities, we're going to
13 turn on some of the other themes like soil borings,
14 I think we're going to start with maybe surface
15 water samples and sediment samples and walk through
16 that and show how it's a type of query, it's a
17 simple query, but it's very visual. So we'll go
18 over to the theme area and we'll turn off, on and
19 off themes that we want to look at.

20 Now, we've clicked on soil sample
21 locations and they showed. We click them off and we
22 click on surface water sample locations, then it
23 rebuilds a map, it actually builds a new map for
24 each new theme that you're looking for, each new

7
1 theme demonstration that you're looking for.

2 Ground water, then water levels, and
3 when we get into the water level location, we're
4 going to demonstrate the other thing I mentioned
5 before, that behind, sort of behind, in a different
6 layer, associated, related to that water level or
7 that ground water sample location and associated
8 water level at that, there's basically wells there
9 in each of those locations. There's a water level
10 associated with it as well as other information like
11 the XY coordinates, you know, from the survey, the
12 vertical elevation based on the latest vertical
13 data. And not only that, within the database, we
14 talk about the quality of the data as well.

15 At the base, we had two survey
16 coordinate systems that we had to combine into the
17 GIS. So we used the NAPD, which is the latest, mid
18 '80s basically, version of the survey coordinates.
19 However, we still mentioned in the database where
20 the data originally came from so people can tell if
21 it's a derived number. We like to maintain that
22 history. So we were on to monitoring well, we show
23 its surface elevation at the ground at the well, its
24 X and Y coordinates, etc.

1 Another thing you might be interested
2 in, I mention you see we had clicked on the
3 buildings, we can use the GIS system to identify
4 features that we see on the maps. We clicked on the
5 tool in the upper -- in the tool bar, and then we go
6 and find -- click on a building or a soil sample or
7 whatever, and we can identify what the thing is.
8 There's all the soil sample locations back again.

9 Now we want to build a query. We're
10 going to ask the database where soil borings at Site
11 1 are located. We happen to know that Site 1 is 01.
12 So it's going to -- now it's just looking through
13 the database, I think there are 33,000 files it has
14 to look at, so it takes a little time to do this
15 job.

16 MR. ROTH: Files or records?

17 MR. TURNER: Records. Well, let's see
18 within the relational database, it would be cells,
19 so they would be records.

20 There's Site 1 soil borings. Now this
21 is a feature on the tool bar, we change our pointer
22 to a tool that we can use to zoom in. Now what also
23 happens here is the preference from the USGS map
24 goes to the CAD drawings. They're still both turned

1 on over there, but the scale now is closer, smaller.
2 And now we're using the CAD drawings that were
3 generated by the NAS JRB, by a contractor in the
4 early '90s, I believe, which we've imported all
5 those electronically into the GIS.

6 Now there are a lot of lines here. It
7 takes a few minutes, it's going to show us where the
8 soil borings are at Site 1 Privet Road. This is
9 useful in helping a person online visualize, well,
10 where are they and what are the buildings. We know
11 that one of the buildings we always talk about is
12 the bowling alley. So here's a demonstration, we're
13 going to find out which one is the bowling alley. A
14 lot of us know which one is the bowling alley. But
15 if you didn't know, you could just go clicking
16 around until you find it. There it is. And it's
17 not a big surprise, there's a whole cluster of soil
18 samples taken around that.

19 Now each of those soil samples, like I
20 mentioned before, not each one, but they're taken at
21 various depth intervals. So we could click on any
22 of those soil samples, find the concentrations by
23 different depth intervals. But what we want to do I
24 think will be to continue a query. This is where we

1 want to find out, ask the system. We know Privet
2 Road, one of the concerns at Privet Road has been a
3 PCB spill in the past. There was a situation where
4 PCB transformers were stored near the Privet Road
5 compound, and there was a spill. So let's ask --
6 we're going to ask the system where PCB
7 concentrations in soil samples at Privet Road exceed
8 10,000 ppb or 10 ppm.

9 So what we did was we opened the window
10 into the database, which was always right behind the
11 map. We just opened the window and we do the -- we
12 build the query. And now it takes a little longer
13 for this. One up in the upper left, you can see the
14 number of records that have to be searched. I think
15 there were 8,400 samples -- hang on a second -- at
16 Site 1. That's the previous number that was used.
17 There are going to end up being fewer. I think 21
18 PCB samples above 10,000 ppb, 10 ppm.

19 You note too, to build the database, it
20 literally took all those years that Jim had
21 mentioned, 15, whatever it is, to collect the data.
22 We, as much as possible, incorporated it
23 electronically. There are 21 samples of the 33,000
24 with PCB above 10 ppm, parts per million.

1 What can we do with this? We can
2 search each sample to see what the depth is and we
3 can plot it, because it's a GIS system. So we
4 plotted it different colors. So the yellow samples
5 are those which are above 10,000 ppb for PCBs,
6 polychlorinated biphenyls, easy for me to say. And
7 then we can zoom in on it by using the CAD drawings,
8 or we could show it on an aerial photograph to get a
9 feel for where those samples were taken in relation
10 to the parking lot and the bowling alley. And those
11 are the last two things we want to do.

12 I have a feeling even though I didn't
13 fast forward much through this, we went pretty fast.
14 So if anybody has a particular question, we could go
15 back to any of the slides, it's not difficult. I
16 can use this control panel in the lower right-hand
17 corner. It gives me a pop-up menu to go back to
18 different slides if we have to do that.

19 But in a minute or two, it's going to
20 show us the soil samples at Site 1 on the aerial
21 photograph of 1995, because that's the one it uses.

22 The real power of this is now Jim
23 Colter, Jim Edmond, and I have a copy of it, we have
24 the GIS on our desks, in our desktops. We have the

1 ARC View software to read it. So we can do any of
2 the queries that you saw demonstrated here. We can
3 build any of the maps that you saw here. And we can
4 print them out in color if we have a color printer.

5 MR. EDMOND: Thanks, Russ. Any
6 questions for Russ on the GIS?

7 MR. COLTER: Just one thing I'd like to
8 mention is one of the reasons that the report didn't
9 get out as quickly as we had thought is that at the
10 same time that they were interpreting the data, we
11 had Russ and his group work on this GIS. And you
12 can see how much data input there had to be, and
13 it's a quite lengthy process.

14 The reason we gave you a little show
15 about this now of its capabilities is, not at the
16 next RAB meeting, but the one after, which will be
17 right in the middle of the review process, you know,
18 we'll be using the online, hopefully GIS system up
19 here, to be shown you what some of the questions we
20 asked, what some of the concerns we were -- wanted
21 to get an answer to, and how we used the GIS and
22 will hopefully graphically show you some of the
23 thought process we went through in coming up with
24 our recommendations.

1 So we wanted to give you a little
2 flavor as to what you can expect and how we plan on
3 using it to interpret that report.

4 MR. LINDHULT: Jim, is the intent to
5 utilize the GIS to select sampling points for data
6 optimization, in other words, where you have data
7 gaps and select the best points?

8 MR. COLTER: Yeah, that will be one of
9 the uses, you know, we'll take a look graphically
10 and in 3D at certain things and see if we have
11 holes. Right off the bat, I can't imagine how many
12 holes we could possibly have with that. But once
13 you see it graphically in 3D, you can pick them out
14 right away, if there's an item that you need to
15 maybe get a better handle on. That's one of the
16 uses we're going to hopefully query.

17 MR. DUNLEAVY: We used to characterize
18 how much soil you take out, you can see it in 3D.

19 MR. ROTH: Question, a couple of them.
20 One, the aerials and the charts are only going to be
21 in looks like four reams of paper there?

22 MR. COLTER: I don't think we have any
23 aerials in there, it's just mostly the CAD drawings
24 in the report there. One of our hopes is, you know,

1 the CAD drawings that were inserted into that report
2 came from the GIS.

3 MR. TURNER: The map in front of you
4 was --

5 MR. ROTH: Have you given any thought
6 to distributing that on a CD? It would be a lot
7 less expensive and gives all the information
8 available to everybody.

9 MR. COLTER: Oh, definitely.
10 Unfortunately, I'm not sure the capabilities of say
11 our regulatory agencies, what their PC capabilities
12 are. The Navy, we tend to be getting some pretty
13 good and expensive equipment. Pennsylvania State
14 may not be in the same position. Certainly
15 community members probably don't have anything at
16 home that has enough memory to run a disk that you
17 would need to run that type of program.

18 If somebody -- I believe if somebody
19 does have the capabilities and is interested in
20 getting the disk, I don't see why we couldn't get
21 one out. But I'd have to check on that because
22 there is some proprietary information issues
23 associated with this.

24 MR. TURNER: To run the GIS, you would

1 need the ARC View software.

2 MR. ROTH: There's not a run time?

3 MR. TURNER: Pardon me?

4 MR. ROTH: There's not a run time
5 period?

6 MR. EDMOND: A loop version, like we
7 just had.

8 MR. TURNER: Oh, you could run that,
9 what we just had you could run on a CD.

10 MR. DUNLEAVY: What does run time mean?
11 What do you mean by the term "run time," a one time
12 use software, shared --

13 MR. ROTH: Allow you to view it and see
14 it, but not modify it.

15 MR. DUNLEAVY: What Russ is referring
16 to is like you need Auto CAD, you need Word Perfect,
17 you need a specific type of software to be able to
18 call up and use in real time. It would probably
19 cost about a thousand dollars at least.

20 MS. FELTON: It's 750 to purchase it.

21 MR. TURNER: It's a product that's
22 commercially available by the company ESRI, ESRI.
23 The other GIS firm is called Bentley, Bentley
24 Intergraph. Those are the two.

1 MR. LEOPOLD: Can we download some of
2 these off the internet through you folks?

3 MR. COLTER: Not at this time.

4 MR. TURNER: However, the data is the
5 same. You see the two volumes there, the data is
6 also included in the second volume. The people
7 don't like to, you know, do that many pages of data,
8 but it's all in there.

9 MR. EDMOND: Plus it also doubles as a
10 good doorstep.

11 MR. DUNLEAVY: I can take it on the
12 train with me.

13 MR. EDMOND: Do some light reading.
14 Any other questions for Russ or Jim?

15 MS. CURTIS: Yes. Will there be a lot
16 of these GIS maps in the report?

17 MR. TURNER: Yeah, there are a fair
18 number of them. We're doing more color, it's easier
19 to read, it's more understandable. It helps
20 visualize things.

21 MR. COLTER: That was one of our goals,
22 again putting a lot of workload on Russ and his
23 company, for the rough draft for our internal
24 review, we really didn't need all the color

1 and the easy-to-read maps, but when it came out to
2 you, we wanted to be in a better position to have
3 some color maps in there and maybe graphically show
4 what we wanted to present, maybe a little easier to
5 see like that.

6 MR. TURNER: Even this rough draft of
7 the RI summary documents, I think there are half a
8 dozen color photographs from the GIS system in here.
9 Things up and running, you know, we're pulling out
10 of the background samples that were taken, that same
11 map there is one of the maps. There are a half a
12 dozen or more. Now of course, this is probably far
13 from complete in terms of getting some comments
14 back.

15 MR. COLTER: I guess what we need to do
16 is at some point pass a sheet of paper around, and
17 if the RAB members could put their name on it and
18 which presentation they prefer to review, either the
19 full volume or the executive summary, we'll make
20 sure we get it out to you as soon as it's ready.

21 MR. EDMOND: There's a sign-in sheet in
22 the back, and there's also the RAB mailing list that
23 I had you all look over and make sure the
24 information and your phone numbers and addresses

1 were correct. What you could do on that one is just
2 put down executive summary or full copy and I'll
3 make sure you get what you choose. And for the RAB
4 members who are not here, I think we'll send them
5 out the executive summary with a letter stating if
6 they want the full blown Phase II RI, we'll get them
7 for them, but I'll warn them how thick and how heavy
8 it is and they could have medical problems getting
9 from the door to the desk.

10 MR. ROTH: The executive summary is
11 included in the large one, in front of it?

12 MR. EDMOND: It's like a Readers'
13 Digest of those two right there, that's what it's
14 going to be. When I say the executive summary, it
15 is the small one sitting there.

16 MR. ROTH: Usually it's included in the
17 report.

18 MR. TURNER: Actually we named that
19 report Phase II Remedial Investigation Summary
20 Report so we wouldn't have that confusion.

21 MR. EDMOND: That's just my
22 nomenclature, executive summary. We'll call it the
23 Readers' Digest version.

24 MS. CURTIS: How much of that

1 two-volume report is lab data?

2 MR. EDMOND: The bottom one is lab data
3 and the top one is text.

4 MR. COLTER: It's not all lab data,
5 it's soil borings --

6 MR. TURNER: All the appendices in
7 general.

8 MR. DUNLEAVY: The forms from the labs
9 are not included in either one of those, right?
10 That's another stack about a foot high, Barbara.

11 MR. TURNER: The summary lab data is
12 probably an inch and a half thick on two sides.

13 MR. COLTER: But the top one has the
14 background information, some overall base
15 information, and then all the information on the
16 four sites we did. That's why it's quite
17 voluminous. It's almost four reports wrapped into
18 one.

19 MR. EDMOND: Each section of each site
20 is summarized also. There's an executive summary --
21 I'll call it an executive summary -- of each section
22 on each site, whether it's environmental assessment,
23 the health risk assessment, whatever, you can just
24 read that if you wish. So it's your choosing.

1 MR. HIBBS: This information will be
2 available online?

3 MR. EDMOND: No.

4 MR. HIBBS: This is just the software
5 package that you're using to compile the data?

6 MR. EDMOND: Exactly.

7 MR. HIBBS: Do you plan on having some
8 kind of information available online at some point
9 based on the ability of the GIS?

10 MR. COLTER: That's something, I don't
11 think any of our sites are online as far as the
12 internet goes, and I don't know what the Navy's
13 intention is as far as the IR program. That would
14 have to be an initiative from our headquarters. And
15 right now, there hasn't been any talk about getting
16 any type of website going or anything like that.

17 MS. FELTON: Part of the problem, if I
18 could add something, Jim, putting GIS online would
19 be incredibly voluminous in terms of data, but also
20 you need the software to run it. And as Russ was
21 with pointing out, the ARC software that is required
22 for this package costs about \$750.00. And I think
23 putting it on the internet would probably violate
24 some kind of license agreement or something. So

1 that would prohibit that kind of distribution.

2 It may be possible to have the CD
3 available, and if somebody had ARC Info available to
4 them, they could view it, and we could make the CD
5 available to you. But we could not put it online.

6 MR. McCAFFREY: How about the direct
7 dialing modem to the database?

8 MR. DUNLEAVY: You'd be on the phone
9 line. You saw how slow it was going here with a
10 Pentium with a direct connection.

11 MR. LEOPOLD: Excuse me, there is a
12 program out AAAs have, it's a toy, but it does
13 handle the GIS. It's the AAA's mapinco by Delorum.

14 MS. FELTON: Right, I'm aware of that.

15 MR. LEOPOLD: And you can run that
16 through, stick it in your car with a --

17 MS. FELTON: That's correct, but that
18 is almost exclusively a mapping program, where the
19 power of the GIS that we've got here that maybe --
20 which we didn't demonstrate entirely, is that it is
21 backed up by mountains of data and things that you
22 can question and query on. It's not just a mapping
23 tool, it's mapping with data behind it. And so I
24 think that program that you're speaking about would

1 fall considerably sort of what we'd need for
2 something like that.

3 MR. ROTH: Let me just clarify, I think
4 what they're talking about putting up is not the
5 running things in the programs, but the output. If
6 the output is put up, then perhaps in, you know,
7 somebody using Acrobat or something like that
8 could -- whatever format you put it up in --

9 MS. FELTON: Well, I'm not a computer
10 wizard, I'll make that clear right up front. I'm
11 not saying that's not possible, I'm not aware of
12 that having been done yet.

13 MR. ROTH: This is output.

14 MS. FELTON: That's correct.

15 MR. ROTH: That's what would go on the
16 website is output, not the running program.

17 MR. EDMOND: It wouldn't be
18 interactive, it would be view only.

19 MR. ROTH: Yeah.

20 MR. TURNER: The database that we have
21 in the GIS is Foxpro, and that's not particularly
22 unusual, but you would be able to access the data
23 through Foxpro, at least that part of the GIS.

24 MR. ROTH: If the data is in ASCII

1 form, you can download it in whatever you want to
2 crunch it in.

3 MR. TURNER: You know, with the --

4 MR. COLTER: Right now, there's no
5 initiative right now to get our data out to the
6 public like that.

7 MR. ROTH: But either the CD Rom or the
8 internet, we're dealing with output either way.

9 MR. COLTER: Right.

10 MR. EDMOND: The CD Rom end of it, like
11 Jim and Debbie were saying, we could get you the CD
12 Rom to use if you had the program to run it, but an
13 internet site, that would be a DoD initiative, or at
14 least a Department of the Navy initiative, and it
15 would have to come from them before we could even go
16 in that direction.

17 MR. ROTH: The CD Rom only has to be
18 the output, it doesn't have to be the running
19 program. So that could be viewable in Word Perfect
20 or Word or several other programs.

21 MR. EDMOND: But it would have to fit
22 into our budget to be able to produce something like
23 that too.

24 MR. COLTER: Just to give you a CD --

1 MR. ROTH: It would cost you a lot less
2 than this.

3 MR. COLTER: We can get you a CD, if
4 you want a CD.

5 MR. ROTH: It would cost a great deal
6 less to distribute.

7 MR. COLTER: Not everyone has that
8 capability so we still have to give our hard bound
9 copies and use the CD.

10 MR. EDMOND: It's got to go in the
11 information repository in Horsham. We're mandated
12 doing certain things. We can't give them a disk, we
13 have to give them a hard copy.

14 MR. TURNER: A lot of those appendices
15 especially are handwritten from the geologists in
16 the field. The text in the report is Microsoft
17 Word. A lot of figures in there come from the GIS.
18 So, you know, it would take more than one software
19 to be able to view that if we did provide it
20 electronically, and lot of it's not available
21 electronically.

22 MS. FELTON: Russ, I think I'm
23 understanding what the gentleman is looking for now
24 is that the report could be put in a format just

1 with like an Adobe, Acrobat type of program that's
2 readily available it could be read, the report
3 itself, not the GIS.

4 MR. TURNER: Even if you don't have
5 Microsoft Word. That's a good point.

6 MR. DUNLEAVY: I still find that it's
7 easier to go to the information repository.

8 MR. EDMOND: Well, if there's no more
9 questions on the GIS, I'd like to have a break, give
10 everybody a chance to relax a minute, and we'll
11 finish up the meeting on a TAG presentation by Bill
12 Hudson. We've done this twice, but we're going to
13 do it again because Jim is going to give us a full
14 blown presentation on TAPP funding and, you know,
15 give you, the RAB members, a chance to see the --
16 compare the two, the apples and the oranges, the
17 TAG, which is an EPA grant, and the TAPP, which is a
18 DoD grant.

19 But we'll take a 10-minute break.

20 (Recess.)

21 MR. EDMOND: If we're ready, we will
22 get started. Mr. Bill Hudson will start. Bill is
23 going to give a sort presentation on the TAG grants,
24 Technical Assistance Grants, that the EPA has for

1 the Restoration Advisory Board. And Mr. Colter will
2 give on the TAPP, which is a Technical Assistance
3 Public Participation Grant, and basically the same
4 thing, but the rules are different on how you get
5 the money, the amount you can have, etc. And you
6 can compare the two and see if they fit into the
7 RAB's agenda.

8 So without any further ado, Mr. Hudson.

9 MR. HUDSON: Well, actually I was
10 hoping that Jim was going to do the TAPP first,
11 because the TAPP program is the DoD program for
12 providing technical assistance. It's a new program,
13 and to the best of my knowledge, there haven't been
14 any TAPP grants actually issued yet; am I correct?

15 MR. COLTER: There was one pilot grant
16 out in California, for a base out there. They ran
17 through what they thought was the rules and tried to
18 see the pitfalls and how it worked. And now there's
19 actually legislation. If you want, Bill, I could do
20 mine, if that's -- it doesn't matter.

21 MR. HUDSON: But I just want to
22 basically point out the differences, and you can do
23 that. The TAG program has been around for about
24 five or six years now. And primarily, I mean, you

1 know, specifically what it's for is to provide
2 technical assistance grants, that is to say to allow
3 residents, actually potential stakeholders or those
4 who are RAB members or residents who live near to a
5 site that has a restoration program to get
6 themselves a technical advisor to help them
7 interpret materials that they may have some
8 difficulty interpreting, such as the couple of
9 volumes that you see on the table there.

10 We have, I think, in Region 3, I think
11 we have at Federal installations about five or six
12 TAG grants. There may be a couple more than that.
13 So approximately maybe 35 percent of the
14 installations have actual TAG grants going at this
15 point and have a technical advisor working for them.

16 The TAG grants generally run in the
17 amount of about \$50,000.00, and the money and so
18 forth is administered by the TAG grant group or the
19 TAG committee. This group can be RAB members, it
20 can be members exclusive of the RAB, or can be a
21 combination. It's an organization you have to form,
22 you have to incorporate this group, which is a
23 relatively simple legal process, and you also have
24 to get tax exempt status in order to become

1 nonprofit, which again is a relatively simple legal
2 process.

3 You have to apply for this grant. We
4 have a full time person located at Region 3, Amelia
5 Levertz, who is very, very helpful in making the
6 application process I would say totally painless.
7 Now we have gotten it down to where it's a
8 relatively simple process, but you do have to follow
9 the rules.

10 And I would go back and try to point
11 out again that in the beginning, unfortunately, I
12 think a lot of times, the people who are thinking
13 about a TAG grant or thinking about this money,
14 they're thinking about using funds to get their
15 point across or to second guess what EPA is doing or
16 the installation is doing, to look into new matters
17 that haven't been looked into. All of these things
18 are not what the TAG grant is for.

19 The TAG grant is to help you interpret
20 what's been put on the table, essentially. It's to
21 look -- it's to help you to understand what EPA or
22 what the installation is presenting to you in terms
23 of what they discovered in terms of possible remedy
24 and so forth and so on. That again is the sole

1 purpose for the grant.

2 And it's to get someone to do this for
3 you, usually someone who's connected perhaps with a
4 university or somebody else who has the expertise
5 to -- we have a lot of recommendations where you can
6 find people to help you do this and you can also
7 bring in your suggestions.

8 We have in a couple of the
9 installations have folks that were affiliated with
10 the RAB that happen to have that expertise that live
11 in the town and are also potential stakeholders. It
12 all can fit in sometimes. Other times folks will
13 pick somebody from a city 5 or 600 miles away, or a
14 university that's quite a distance from the site,
15 that's a general idea.

16 I brought some materials on it. I
17 don't have I think enough for everyone. But
18 there's, you know, the basic rundown again of the
19 program. And then I have a couple of application
20 process handbooks that, you know, you can look at
21 afterwards.

22 And again, I can provide the contact at
23 Region 3 who would be glad to speak with any of you
24 and talk to you about the application process. Does

1 anybody have any questions?

2 Actually I did this presentation for
3 this group about a year and a half ago and we went
4 through it, you know, in great detail. And I'm
5 hoping that maybe perhaps since that time there was
6 some thought about it for or against. If anybody
7 has any questions.

8 CDR. WOOD: Sir, am I correct in the
9 assumption that these are actually matching funds,
10 the amount of money that comes from your agency?

11 MR. HUDSON: I really didn't get to
12 that part, but yes, it's a good -- it's not exactly
13 matching, it's sort of you have to make up for some
14 of the money. And there's different ways you can do
15 it. Most of it can be done in-kind, that is to say
16 if you perform the office work and so forth that's
17 necessary for some portions of it, or you do the
18 paperwork --

19 MR. ROTH: Can you sort out for him and
20 for me, when you say "you," it's a pronoun, who are
21 you referring to?

22 MR. HUDSON: You would be the TAG
23 group.

24 MR. ROTH: The TAG group, not the U.S.

1 Navy?

2 MR. HUDSON: Yes. The Navy would
3 actually have little to do with this TAG grant.

4 CDR. WOOD: So the corporation that
5 would need to be formed --

6 MR. ROTH: Where is the corporation
7 going to get this money?

8 MR. HUDSON: That's what the grant is
9 for.

10 MR. ROTH: Is this a Catch-22, say we
11 get the grant but we have to match it and we're
12 going to use the grant to match it?

13 MR. EDMOND: The matching is more or
14 less in sweat equity, we'll put it. The work that
15 you put into the process along with the money, say
16 you Xerox all the literature for passing out to the
17 RAB members or the office work in sorting out the
18 data or finding the technical representative you
19 use, that's what they're talking about.

20 MR. DUNLEAVY: Even mileage driving to
21 to and from the meetings and stuff like that I
22 believe comes into play. The group has to
23 demonstrate that they've been expending effort time
24 and money --

1 MR. EDMOND: Sweat equity.

2 MR. DUNLEAVY: -- in seeing what's
3 going on at these meetings and that they need
4 further assistance, they have to demonstrate that
5 they've spent, you know, a certain amount of
6 dollars. I don't know what the amount is, but once
7 they demonstrate that, they can get the grant.

8 MR. HUDSON: I'm not exactly sure of
9 exactly the amount that you have to make up, and
10 it's not -- it's a portion, I think about a quarter,
11 but I'm not exactly sure on that.

12 But the point of it is that you could,
13 for instance, use part of that money to have the
14 office type work done for you. Another thing you
15 could do with TAG grant money is to get fact sheets
16 together and issue them to the public, that money
17 can be used for that. You could also put a value on
18 the time that you spend doing these things, and that
19 would be a part of your in-kind matching money.

20 You could, for instance, you could hire
21 someone to try to find the technical advisor for
22 you, but if you do it yourself, you can put a value
23 on that and use that as part of the matching grant.
24 This is something would be a very good idea to

1 discuss with Amelia Levertz, because she knows
2 exactly per se what you have to say. But that's the
3 idea, and I'm glad you brought that up.

4 MR. COLTER: Bill, I'll just point out
5 that I attended a training course on TAPP, and one
6 of the modules was the comparison to TAG, so I do
7 have a presentation. If it were come to the group
8 wanting to pursue a TAG versus a TAPP, you know, we
9 could go ahead and put this presentation up and come
10 down to some of the rules. But I think when you see
11 the differences and some of the benefits between
12 TAPP and TAG, you may not want to pursue TAG as much
13 as DoD's TAPP grant, if you want to pursue it at
14 all.

15 MR. HUDSON: The TAPP program is
16 basically a program where you ask for a technical
17 assistant and the DoD entity takes care of it for
18 you. I mean that's the short story. This you
19 wouldn't have much in the way of administering
20 situation. And the difference there is with the TAG
21 grant, you have moneys that are provided to the
22 group. Of course you have to go through the
23 processes that I mentioned, and then you administer
24 the grant and get reimbursement from the government.

1 So yeah, there's some major differences there. And
2 when Jim does his, you'll see, you know, a major
3 difference there.

4 Another thing, Jim, and I don't know
5 whether you found out or not, I still have not been
6 able to get a clearcut picture on whether there can
7 be a TAG and a TAPP grant.

8 MR. COLTER: No. I'll go over that.

9 MR. HUDSON: Thanks.

10 MR. EDMOND: Thanks, Bill. Jim?

11 MR. COLTER: At the last meeting, there
12 was an interest in this new DoD initiative called
13 the Technical Assistance for Public Participation.
14 And it just so happened that between the last
15 meeting and this meeting, I attended a pretty
16 intensive training seminar down in Washington about
17 the TAPP. And I know that Mr. McCaffrey, you asked
18 about maybe a pamphlet of some kind, and that's what
19 I have here. And if you need anymore, if you want,
20 let me know, I'll get you as many as you want.

21 The TAPP program, what we're going to
22 briefly go over, I scaled down the training session
23 that I went to into something a little more
24 manageable. I'll describe what the TAPP is, the

1 purpose behind the TAPP, who's it for, why would the
2 DoD even want to enter into some kind of program
3 like this. Then we'll go into how the RAB itself
4 would get assistance provided. We'll define what
5 projects are eligible, and we'll go over some rules
6 and responsibilities of the RAB group and the DoD
7 group.

8 What is TAPP? It was initiated and
9 language entered in the National Defense
10 Authorization Act of '96. That language has not
11 been finalized yet, so everything here is based
12 on -- it was supposed to be final -- the proposed
13 rule was supposed to be final in December of '97.
14 Down in Congress, things, you know, usually don't
15 happen on time. It is expected though to be final.

16 Basically from the language of the law,
17 Technical Assistance for Public Participation is a
18 program which can provide independent assistance in
19 interpreting scientific and engineering issues with
20 regard to environmental hazards at restoration
21 activities. The goal of the program is to enhance
22 the public's ability to participate in the decision
23 making process by improving their understanding of
24 overall conditions and activities.

1 Why should we have this? Well, as you
2 can see on the table there, pretty voluminous type
3 of reports that we send out periodically. We have a
4 right to involve -- you have a right to be involved.
5 You, the public. It also demonstrates the
6 commitment of the DoD to the community. It enables
7 you to better participate in the technical aspects
8 of our program. It would provide you a more
9 credible source of expertise, if one doesn't already
10 exist, and I'll explain that a little bit more. The
11 last one, restore trust if our credibility is low.
12 Hopefully, that's not the issue here at Willow
13 Grove, but there are RABs in place where government
14 and federal credibility is low and the RAB has a
15 right to challenge the DoD's decisions.

16 Who is it for? Basically, community
17 members of the RABs.

18 Now, you need to justify why you need a
19 TAPP. The RAB community, and the key word -- I
20 probably went too fast -- is to demonstrate a need
21 for this type of assistance. And a demonstrated
22 need, you have to answer one these two criteria in
23 the law. The first criteria is the RAB must
24 demonstrate that, in this case the Navy, or the EPA

1 or State responsible for overseeing us doesn't have
2 the technical expertise to explain the issues to
3 you. Nine times out of ten, you won't be able to
4 meet that criteria. So there's a second criteria.

5 The technical assistance is likely to
6 contribute to better efficiency, more effectiveness,
7 more timeliness of a review. And at the same time,
8 it was likely to contribute to your acceptance of
9 our information. So that's where the justification
10 would lie that it's easier for you to understand,
11 you're hiring somebody to put it in laymen's terms,
12 that type of thing.

13 The first -- it's kind of confusing,
14 but the first criteria is you have to meet one of
15 the previous two criteria items. The second
16 criteria is there must be a majority of the RAB must
17 agree, there must be a majority vote that this type
18 of assistance is needed.

19 When I say that there's no technical
20 expertise out there, what we're going to offer you
21 is other avenues to get your issue resolved. One of
22 the first avenues would be our installation
23 restoration contractor, Brown and Root or EA
24 Engineering, the people that are working for us. I

1 believe to date Russ and his group have done a
2 pretty excellent job in explaining the issues and in
3 laymen's terms. So to say that the expertise
4 doesn't exist, you know, is not quite accurate.
5 There's also local, state, and federal staff.

6 Bill just gave you a presentation on
7 TAG. If you wanted to learn the ins and outs of
8 TAG, you wouldn't be able to hire a technical
9 assistance provider, Bill has done that for you.

10 In previous RABs, we gave you a
11 toxicological training session by Navy Environmental
12 Health Center. The next RAB actually we'll be doing
13 another one on risk assessment, human health risk
14 assessment, definitions, terminology. That's
15 another eligible project that you could hire a
16 technical assistance provider for. We do it for
17 free.

18 The other avenues of support,
19 universities, as Bill had mentioned, sometimes
20 universities like to come in and do a thesis on one
21 of our sites and that's usually low cost.

22 The other avenues of support is what
23 Bill went, over the TAG grants and TOSC grants.
24 TOSC is basically the same thing but only available

1 for non-NPL sites. So if you have a TAG grant --
2 this goes back to Bill's point -- if you have a TAG
3 grant, you already have an avenue for technical
4 assistance; therefore, you cannot get a TAPP grant
5 at that point.

6 The reverse though I believe is not
7 true, if you have a TAPP grant, you can get a TAG if
8 you're willing to incorporate, provide in-kind
9 matching services, and do the contract
10 administration portions of it, you can probably get
11 a TAG if you have a TAPP. But you can't get a TAPP
12 if you already have a TAG. If that's clear, I don't
13 know.

14 Why should the DoD initiate a program
15 like this? Well, it promotes us as a good neighbor.
16 It increases the DoD's confidence in our program, as
17 we are allowing it to be subjected to a third party
18 review. It hopefully increases your confidence in
19 what we're doing as you see our willingness to share
20 information openly. If you meet those two items,
21 you obviously should get a more responsive cleanup,
22 less issues at the end of the road.

23 Now, how is the assistance provided?
24 As Bill had mentioned, TAG grants, you have to

1 incorporate and therefore the corporation has to do
2 the contract administration, the scope of work, you
3 have to procure the contractor, do the invoices,
4 things that many of you may not have the expertise
5 in doing.

6 TAPP, the DoD will do all that contract
7 administration for you. We'll help you procure a
8 technical assistant. We won't pick one, but we'll
9 help you get him under contract. We'll utilize your
10 input in the selection criteria process of what goes
11 in the scope of work. We'll use existing
12 environmental restoration funds. But because we do
13 that, we have to put a limit value on the dollar
14 amount.

15 Because we want to use what's called
16 simpler acquisition procedures, we have a 25
17 thousand dollar maximum, or one percent of what we
18 call a cost to complete, which is a program we use
19 to put in general questions and answers. And
20 through a cost program, you get a bottom line. And
21 we have done that for Willow Grove, but it has a lot
22 of subjectivity to it, since we don't have, at the
23 time we did the cost analysis, we didn't know how
24 much soil we had to remove, how many ground water

1 wells we might have to put in, things like that.
2 It's more the 25 thousand dollar cap that will
3 govern it.

4 You also see a hundred thousand dollar
5 lifetime limit. For the life of this RAB, you'll be
6 able to get only a hundred thousand dollars of TAPP
7 funding. If that's four big 25 thousand dollar
8 projects, so be it. It may be 10 10 thousand
9 dollars projects. This is in there so it doesn't
10 appear that we have an open checkbook. It puts a
11 lot of onus on the RAB of what projects do you
12 really need third party assistance that we can't
13 provide you as the Navy.

14 The benefits of us managing the TAPP
15 contract obviously eliminates the burden of contract
16 administration on the RAB members. Your only
17 responsibility really is to fill out the application
18 form. You will not have to incorporate as a
19 citizens group, therefore, you will not have to come
20 up with any in-kind matching funding.

21 What are eligible projects?
22 Interpretation of technical documents, review of --
23 and there's one on the table there -- review of
24 proposed restoration technologies. There will be a

1 similar report called a feasibility study coming out
2 after we get through this process of documenting
3 what our proposed technologies are.

4 Participate in relative risk site
5 evaluations, which is the Navy's way of prioritizing
6 our sites. Understanding health and environmental
7 implications of cleanup strategies, and training,
8 the NEHC training on toxicology, risk assessment,
9 those type of things. You know, technical
10 documents, risk assessments, human health risk
11 assessments, the proposed restoration technologies,
12 considering different alternatives, again helping,
13 you know, understanding what relative risk is and
14 how we use it to prioritize our sites. The
15 implications of cleanup strategies, training.

16 Ineligible projects, things that you
17 will not get a TAPP grant for, political activities
18 and lobbying, legal type actions against the Navy,
19 if it was warranted, generation of new data. The
20 point here is you cannot hire a consultant to go out
21 and take samples for you and do an independent study
22 on the property. That will not be funded.

23 Reopening DoD, the final DoD decisions,
24 such as ROD, things like that, you will not be able

1 to do that. And basically the last one, community
2 outreach. If you wanted to put together a fact
3 sheet of your own about how the RAB is working at
4 Willow Grove, you're more than welcome to do that,
5 however, you will not get DoD funding for that. We
6 provide that in our fact sheets, this pamphlet that
7 I handed out, things like that.

8 After we get results, it's incumbent
9 upon us to publicize the results. We'll put the
10 results of the report in the information repository.
11 We'll announce it at the public meeting, probably
12 have a presentation on it. And obviously if the
13 results come back, useful results come back, we'll
14 incorporate those into our IR program, things that
15 we overlooked.

16 There is an appeals process. This has
17 been established so that the RAB members can appeal
18 decisions regarding approval or disapproval of a
19 project. I'll go into this a little bit more down
20 the road, where the installation commanding officer
21 has the final say on whether a TAPP grant gets
22 approved or not. If you don't agree with that, if
23 he denies a project, there is a process in here for
24 your appeal.

1 If the appeals process cannot be
2 resolved at the CO level at the installation, it
3 will go up to his major claimant. If he can't
4 resolve it, it will actually go up to Assistant
5 Secretary Navy level. This is for information. I
6 don't foresee that ever getting to that point.

7 Some ground rules for the appeal.
8 Again, there must be a majority of the RAB that
9 wants to pursue the appeal. You must then appoint a
10 single spokesperson, have some written
11 justification. The appeals have to follow the chain
12 of command that I previously showed. And obviously
13 the goal is to try to resolve these issues at the
14 lowest level possible. In this room is the lowest
15 level possible. And we will try to resolve any and
16 all issues here before they have to go up to the CO.

17 This is kind of a flow chart of pretty
18 much what I've just gone over. The RAB will
19 determine that there's a need. At that point, the
20 DoD co-chair, which is pretty much we will assist
21 the DoD co-chair as DoD representatives, we'll
22 assist you in preparing the application. You will
23 then forward the application to us for review -- to
24 the DoD co-chair.

1 And I'll go through a lot of this in a
2 little more detail, but we're going to try to tell
3 you what's eligible and ineligible. So whatever we
4 send up to the installation commanding officer will
5 be an eligible project. If we already know the
6 rules in here, there's not much sense in sending
7 something up that we already know is going to be
8 denied.

9 If the installation commander sees that
10 the project is eligible, then our contracts office
11 down in Northern Division will start putting the
12 contract administration wheels moving and getting a
13 preferred provider under contract, one of which you
14 have selected already.

15 We'll do contract administration.
16 We'll get the assistance. He'll do whatever the
17 project is you've hired him to do and provide a
18 closeout report.

19 Some other key individuals, the DoD
20 representatives, myself, the Commander, Jim, Debbie,
21 community reps, all of you, and the installation
22 commanding officer. Our roles pretty much are to
23 inform and train you. That's what I'm here tonight
24 to do. We should ensure that funds are available,

1 and to most of the extent, funds will be made
2 available if a project is warranted.

3 Contract management of the contractor,
4 we're here to work with you in the application form.
5 We also help the commanding officer. We'll report
6 the results.

7 We will act as a moderator for the RAB,
8 if that's needed. And you can imagine with 20 some
9 different members, there could be different agendas
10 that certain individuals want to pursue. Again,
11 we're going to try to moderate that for you so you
12 can focus your needs on what projects you need. You
13 only got 25 thousand a year, a hundred thousand
14 dollars for the life of the RAB. So you have to be
15 focused on what project do you really need us to
16 fund, again, other than what we can give you for
17 free.

18 Working with the RAB, we'll help you
19 determine if you've met the criteria in the National
20 Defense Authorization Act. We'll also certify that
21 there is a majority of the community members that
22 want this. We'll help you define and scope out an
23 eligible project. We'll help you certify a search
24 for alternate support, that alternate support does

1 not exist either from our contractor, a university,
2 things on that slide I showed you.

3 We'll propose, we won't select, a
4 technical assistance provider. We may have a list
5 of a database of who we feel is a competent
6 contractor. By no means do you have to follow that,
7 but we do have a pretty extensive list of
8 contractors out there in the environmental field.
9 And we'll help you complete the TAPP request form.

10 Working with the CO of the base, we're
11 going to work with him to recommend project approval
12 or disapproval. Again, if it's not going to be
13 approved, we won't even send it up. So those will
14 only be approval projects.

15 We'll recommend waivers. There is a
16 waiver to the 25 thousand dollar limit, but there's
17 a process you have to go through to try to prove
18 that you need more than 25 thousand dollars to
19 review a project. We'll also, again, put the
20 results in the information repository and other
21 publications. We'll devote a RAB to announcing what
22 the findings of that contractor came up with, and
23 we'll incorporate those results into our program, if
24 they got some good ideas. We're not -- we are

1 willing to incorporate new ideas. We don't pretend
2 to know all the answers.

3 I mentioned this a little bit before,
4 we're going to help you reach consensus, if
5 required, to pursue your top priorities, what should
6 the project provide, these are things that go into
7 the scope of work to potential providers. We'll
8 help you review qualifications that they submit and
9 maybe help steer you in a direction of what we think
10 is a good provider. And we have a role in the
11 appeals process basically to keep you informed of
12 discussions between the CO and the DoD members of
13 the RAB. We will be your advocate with the CO, why
14 this needs -- why this appeal should go through.
15 And we will have some alternatives ready so he can
16 make a better decision.

17 Your role as community members, you
18 need to have an understanding of our installation
19 restoration program. Hopefully, the last several
20 meetings, you've kind of got a flavor for what our
21 program is, some of the terminology. You need to
22 focus on your needs, what's an eligible project,
23 what is ineligible. You need to come to some
24 agreement about what the project is going to be. If

1 the project dollar amounts are small enough, you can
2 have two or three projects in a year, if so
3 warranted. And you must meet the requirements of
4 the law. And basically, you know, you have to
5 answer and prove can the information be provided
6 without TAPP funding, or will this project help you
7 better understand what you're reviewing and help
8 your acceptance of what you're reviewing. Then
9 we'll fill out the TAPP request form.

10 And that's about all I'm going to say
11 about that right now. If we get into a situation
12 where a TAPP project is felt to be required and we
13 pursue that, I'll come back up and we'll go through
14 the TAPP request form and help you get it filled
15 out.

16 Nominating a provider, there are
17 minimum qualifications in the law that have to be
18 met in order for somebody to be considered a
19 provider. You, as basically the customer, can
20 obviously write in any other qualifications that you
21 want to try to narrow down people that submit quotes
22 for the work. As a minimum, they must have a
23 demonstrated knowledge of hazardous or toxic waste
24 issues and laws. They must have academic training

1 in the relevant disciplines. And they must be able
2 to translate technical information into laymen's
3 terms. Other examples of what you might want them
4 to have is some experience in working on a hazardous
5 waste site, knowledge in the local geology here,
6 some experience in technical presentations, a couple
7 others that, just to throw out that you might want
8 to write in your scope of work.

9 After the project's completed, there's
10 some -- there's some requirements, just reporting
11 requirements. The contractor has to give you a
12 report, and that report must be made available to
13 the general public.

14 And the last role is of the
15 installation commander. I've pretty much gone over
16 his roles throughout the presentation. He is tasked
17 to implement the law. We should have already done
18 that if we've done our job, and we will not be
19 forwarding an ineligible project, hopefully. He
20 will approve the projects ultimately so funding can
21 be released from the DoD. He'll ultimately
22 recommend waivers to the funding. And again, he has
23 a very substantial role in the appeals process.

24 For approving the projects, there's

1 some questions, is adequate funding available,
2 does -- he's going to ask us does the project meet
3 the eligibility criteria, and is there a majority
4 request, is the majority of the RAB interested in
5 having a certain project.

6 If he disapproves a project for any
7 reason, he'll have to -- it's probably because of
8 funding, failure to meet eligibility, or that he has
9 determined that there are alternate sources out
10 there. And he will have to give you his rationale
11 and some alternatives back to you of why he
12 disapproved the project.

13 Again, there's waivers to the funding.
14 With the CO's blessing, he'll send it up the chain
15 to the DoD to release the funding. They will
16 ultimately though have the final say whether they
17 grant the waiver or not. And that's his role in the
18 appeals process. The lowest possible avenue to get
19 it resolved, again this room is actually below him.
20 We should get all our issues resolved at this level.

21 That's TAPP in a nutshell. Again, it
22 was a three-day training course down in D.C.
23 There's a lot more on the TAPP request form, things
24 like that that may or may not come up. But again,

1 TAPP isn't available as of yet. The rule hasn't
2 been finalized, but it's imminent, as I'm told, that
3 it will be available. And if the RAB here thinks
4 that there's a project that they would like to have
5 funded, we can certainly start dialogue and
6 discussion of why you need it, what's it going to
7 accomplish, and some of the other benefits that go
8 along with the rules. Any questions or anything?

9 MR. EDMOND: Thanks, Jim.

10 MR. HUDSON: Just a couple of points
11 that you brought to mind that I thought we should
12 mention. If I understand correctly, the TAPP
13 program is only for RAB members; is that correct?

14 MR. COLTER: In this case, yeah. It's
15 also for TRC groups, but it's for RABs and TRCs,
16 yes.

17 MR. HUDSON: And I just wanted to point
18 out that the difference with the TAG program is that
19 the program is available to a group organizing
20 itself to apply for the TAG, not necessarily RAB
21 members, but it could of course include RAB members.
22 And another point is that when this group does make
23 application for the TAG grant, we place an
24 advertisement in the paper and so forth to try to

1 let the public know that this grant is being applied
2 for. And it asks people to either join up with you,
3 or if they want to counter you, to try to form their
4 own group and make their own application so that
5 they can be considered at the same time as you. So,
6 you know, I think that's an interesting distinction
7 there as well.

8 MR. COLTER: One point I didn't bring
9 up, there is a clause, a conflict of interest clause
10 in the law. It's similar language to what's in the
11 RAB dialogue, that RAB members have to come because
12 they represent the community, not to come in search
13 of work.

14 Same rules apply to TAPP grants, if
15 there's -- if you have someone you know that can
16 provide a certain service, you can go ahead and say
17 hey, I know this guy. Because of the funding limit,
18 it's very easy for us to basically sole source out
19 to that person. If the person happens to be on the
20 RAB -- and I'll use Eric Lindhult as an example, he
21 works for Dames and Moore, Dames and Moore will not
22 be getting a TAPP grant because he is on the RAB and
23 there is a conflict of interest type of clause there
24 for that. But if somebody knows a neighbor that's

1 an environmental consultant -- and we're dealing
2 with small business, we're not going to be going to
3 like Dames and Moore or some of the other bigger
4 environmental firms, we're going to be dealing with
5 small business contractors. If somebody knows a
6 small business contractor that's in the
7 environmental field, if he meets those minimum
8 qualifications and you are comfortable with that
9 person as being able to provide you the support,
10 it's a simple process to get them under contract.

11 Other than that, you can put notices in
12 the paper, any other way to get the word out. And
13 all that we need is three independent quotes. We'll
14 do a little estimate of what we think the project
15 will cost, and we'll review those quotes. It's not
16 a low bid type of thing. You certainly can choose
17 the low bid if you want, or you can go with the most
18 expensive bid if you think he'll give you a better
19 dollar value. There's a little bit different
20 contract administration because of the limits on the
21 dollar amount.

22 MR. EDMOND: Any questions?

23 MR. ROTH: I'm inclined, just speaking
24 as one person here, to think that -- I don't feel a

1 need for this. That said, I sense a push by the DoD
2 employees towards the TAPP, which is less
3 independent than the TAG. The other thing is that
4 depending on what the people in the RAB feel, even
5 if it's not felt that we really need it, time lines
6 and bureaucratic delay being what it is, it might be
7 worth considering applying. That doesn't mean you
8 have to spend it, but it does get the time line
9 running. Comment?

10 MR. COLTER: Well, as far as our
11 preference, the DoD really doesn't have a
12 preference. The preference would be incumbent upon
13 what the RAB wants to undertake. If you do
14 undertake the TAG program, those of you who are in
15 the corporation will have to do all the contract
16 administration. We're here to provide that for you.
17 That's just a benefit of us doing it. The in-kind
18 matching services, the ability to incorporate as a
19 nonprofit organization, all of that is somewhat
20 cumbersome. None of that is needed with the TAPP.

21 We're here to run the contract, get
22 them under contract, spell out the scope of work
23 that you define and use our contacts to get a
24 consultant under contract immediately.

1 Yeah, there are a lot of bureaucratic
2 delays with this, but you cannot apply for a TAPP
3 grant unless you have a specified project in mind.
4 That's part of the application form. That's why if
5 you think one is needed, and we're at a stage now
6 where we have a draft report coming out in mid
7 March, if the rule was final and funding was
8 available, yeah, we'd have to start maybe right now
9 in scoping out a project, filling out the
10 application form, picking a consultant for you, you
11 know, you guys -- I'm saying us as a RAB -- picking
12 a consultant that you're comfortable with to try and
13 keep us on our schedule as much as possible.

14 If that's not possible, my opinion, the
15 way that I run the program, I'm more than willing to
16 delay certain milestones if your contractor isn't
17 ready to give out a report. By no means am I going
18 to finalize a report without, you know, if timing
19 isn't there, we'll make the necessary adjustments to
20 get his report incorporated into our document.

21 MR. EDMOND: Any other comments,
22 questions? Any comments or questions on anything
23 that was talked about this evening? Then I'd like
24 to close up the meeting then with setting a date for

1 the next meeting. We usually pick a date, give you
2 two dates and it's a three --

3 MR. ROTH: Wait a minute. Wait a
4 minute. We do have this particular thing on the
5 table and whether we should be proceeding or not.

6 MR. COLTER: It's everliving. It's
7 always on the table.

8 MR. ROTH: To close the meeting now,
9 this dies.

10 MS. GEMMILL: I don't think it dies.

11 MR. ROTH: But it puts it off for
12 whatever period of time.

13 MS. GEMMILL: Well, it tables it for
14 the next meeting.

15 MR. COLTER: Your community co-chair,
16 if there's a need between this meeting and next
17 meeting and somebody wants to -- again, it's the RAB
18 community members that must come to a majority. I
19 would suggest calling Liz, maybe having a small
20 get-together of the RAB members outside of the RAB
21 meeting and discuss whether you want to pursue this
22 or not. By no means does it die after this meeting.

23 MR. ROTH: I mean I spoke as one member
24 and I said I don't really see the need for it.

1 MR. VETRINI: Well, I have to agree
2 with you. As a taxpayer, to me, you guys have been
3 doing a fantastic -- I don't understand 99 percent
4 of what you said, but you're doing a very good job.

5 MR. COLTER: We need to do a little bit
6 better job then. We need to make sure you
7 understand it.

8 MR. LEOPOLD: I have to agree with the
9 two gentlemen. From what I've received, and again
10 I'm in the same boat as you are, I don't know 99
11 percent, the information we have been receiving, it
12 is an ongoing investigation going on with these
13 various sites, etc., etc., I mean what are we
14 looking for to be spending extra money, what are we
15 proving?

16 MR. COLTER: And that's a key point
17 that the funding, not the way the Navy is
18 structured, but for other services, Army and Air
19 Force, where their funding is driven by the
20 installation, the key here is that the money comes
21 out of the same pot that's appropriated. There's no
22 separate pot of money. So if you spend 25 thousand
23 on a TAPP project, that's 25 thousand dollars of
24 cleanup or investigation that doesn't get done.

1 The Navy is set up a little bit
2 differently. It's a little bit easier for us to go
3 off and pick up an extra 25 thousand because we have
4 regional offices like where I work down in
5 Philadelphia that manages the money. And if another
6 project manager in my office can't spend money in
7 his base, we can get a hold of it and filter it up
8 to Willow Grove. So it's a little bit different
9 aspect, but it's a good point that overall there's
10 no new money. And the environmental restoration
11 fund is going down yearly by several hundred million
12 dollars.

13 MR. LEOPOLD: I have to be honest, we
14 were sitting over there in NAWC, or formerly what
15 was NAWC, that might be a whole different ballgame
16 because heaven only knows what's sitting over there
17 in that dirt over the last 15 years.

18 MR. ROTH: Let me say that it's the
19 same outfit that ran it.

20 MR. LEOPOLD: No, sir, I have to
21 disagree. I've been around this base for 30 years.
22 There's pretty much fuel, wash fluids, hydraulic
23 fluids, oils. There's no sophisticated -- in the 30
24 years that I've been involved in this base that I

1 knew of, and I was stationed here -- any
2 sophisticated chemicals, in quotes, as there
3 possibly could have been in NAWC, and I'm not saying
4 that there was. But over there was a lot of
5 experimentation going on.

6 MR. ROTH: You drink bottled water over
7 there?

8 MR. LEOPOLD: No, I live in Warminster
9 Township and I drink the township water and I'm
10 healthy, at least so far.

11 CDR. WOOD: Let me just say that
12 regardless of what the contaminants are either here
13 or over there, that we're going to continue from the
14 Navy's perspective to try to make it clear what
15 we're doing and what the best course of action is
16 going to be. We consider ourselves members of the
17 community and want to clean it up as much as you all
18 do.

19 And I would say at the minimum, let's
20 go through the process and try and get the executive
21 summaries out so that they're clear. If they're not
22 clear, we'll try and make them clear so that
23 everybody understands what the issue is. And if at
24 some point we're not satisfied with that or the

1 board's not satisfied that we've made it clear, then
2 we can pursue the TAPP or the other program. Does
3 that seem reasonable?

4 MR. ROTH: I think it would be a little
5 bit more comforting if the commander were here
6 himself, which I assume you're not.

7 CDR. WOOD: I'm the Executive Officer,
8 co-chair of the committee. And the CO of the base
9 has the same feelings that I've just expressed to
10 you as far as wanting to ensure we have the proper
11 cleanup of the base, and as Colonel Moss is here for
12 his side of the base, you know, he's fully on board
13 with this. Just at this point in time, it's not
14 appropriate for him to be sitting in on these
15 meetings.

16 MR. EDMOND: May I add, as the ExO
17 said, as the executive officer, DoD mandates that
18 the executive officer sits as the -- is the selected
19 person to sit as the co-chair for the military with
20 the community co-chair, not the commanding officer.

21 CDR. WOOD: One of the reasons for that
22 is he's in the appeal chain. So if he's in the
23 process of making the decision, then he doesn't have
24 that separation to be able to stand back and do an

1 appropriate appeal.

2 MR. EDMOND: And when the meeting is
3 adjourned, it's just this meeting is adjourned. The
4 process does not adjourn, it continues. I'm always
5 available, Jim is always available, the Public
6 Affairs officer is always available, both the Navy
7 and the Air Force. Any information you need, it's
8 at the information repository. And Jim and I are
9 both, you know, more than happy to answer any
10 questions you may have or direct you to somebody at
11 EPA or PaDEP.

12 MR. ROTH: The reason I stopped you
13 because I hadn't heard from any of the people at the
14 RAB, and I expressed a personal opinion.

15 MS. GEMMILL: Well, you want the
16 community co-chair to state her opinion? I think
17 they're doing a wonderful job, I really do. I'm
18 very impressed at every meeting that I've attended,
19 and I think I've been to every one, right, Jim?

20 MR. EDMOND: Yes, ma'am.

21 MS. GEMMILL: I think fortunately we
22 are not out as the community, civilian community,
23 we're not out to get the military. I don't think
24 the military is hiding things. I think they're

1 being very upfront and open with us. I appreciate
2 that as a taxpayer. And I think that we can
3 continue working together.

4 I think if there's problems, we work
5 together and clean it up. I think the grant money
6 is there. If we find that we need to apply for it
7 at some point in time because there's a project that
8 we want to undertake, then that's what it's there
9 for.

10 MR. COLTER: That's a key point that
11 the credibility --

12 MS. GEMMILL: That's personal.

13 MR. COLTER: The credibility question
14 is what's key. And we do have RABs at military
15 installations where there's a lot of distrust,
16 things like that. And I think the DoD recognized
17 that there was a level of distrust, but the way the
18 process was, it was that's too bad, we're going to
19 continue on with our schedule. And I think that's
20 not really a good business decision when you're
21 dealing with diverse community groups. So it's
22 their way of saying, well, here's something we'll
23 throw out on the table to try to build our
24 credibility back up with you.

1 As I said earlier, I hope that isn't
2 the situation at this base; and if it is, we need to
3 address it immediately, but I don't get that feel.

4 What we're going to do as an example is
5 when you get this report in mid March, and maybe
6 even before then, you'll see a lot of discussion on
7 human health risk assessment, ecological risk
8 assessment, you'll see the term used, you'll see
9 formulas. And if you don't understand it, and quite
10 frankly, I don't understand it entirely, we have
11 experts. And Barbara Douglas is one of those that
12 interprets and makes sure the contractor has used
13 the formulas in the right context. It's a
14 cumbersome process, although we use it at times to
15 base cleanup goals. So you have to understand the
16 basics of risk assessment.

17 That being said, if we were not going
18 to do what we're going to do at the next meeting, I
19 would suggest that would be a perfect TAPP grant
20 project, get somebody in here to teach us what is
21 risk assessment, how is it used.

22 One of the ultimate sources though,
23 we're going to provide it to you. Next meeting Navy
24 Environmental Health Center will be up, and he'll

1 give a presentation and a training session on risk
2 assessment. If you need more training than that, at
3 that time we'll have to, you know, address that,
4 depending on how good a job they do.

5 But that's kind of how the process
6 works. Nine times out of ten, we're going to try to
7 provide you with a credible source of information if
8 we can.

9 MR. EDMOND: It will be the same
10 gentleman who gave the toxicology will be up here to
11 do risk assessment in March. What we have planned
12 is to make the next meeting for 4th of March, which
13 is a Wednesday evening. That will be before you get
14 these reports, to give you some background so you
15 kind of have some understanding on what you're
16 reading when we talk about risk assessment.

17 And if no one has any problems with
18 that, we'll make the next meeting for 4 March, right
19 here, same time, 6:00 in the evening.

20 Anymore questions or comments? We have
21 the next meeting set. As I said, it will be a NEHC
22 presentation. There will be some other information
23 given out at the meeting also, but the majority of
24 the focus will be on risk assessment to give the RAB

1 background on what they're going to dive into in the
2 next reports.

3 MS. REIGH: I have a comment to make,
4 being a newer member to this group, and I am the
5 State regulator, would it benefit you to give a
6 brief presentation on our setup and how we deal with
7 what comes in from this base and how --

8 MR. EDMOND: We would be more than
9 happy to have you give a presentation.

10 MS. REIGH: -- how we look at it.

11 MR. EDMOND: That would be great.
12 Would you like to give a presentation?

13 MS. REIGH: Yes.

14 MR. EDMOND: How about if I give you my
15 card after the end of the meeting, give me a call
16 and we'll talk and set it up and what you're going
17 to talk about, what your needs would be, and put you
18 on the agenda.

19 MS. REIGH: Because we can Power Point
20 up on the screen.

21 MS. HUGHES: That would give you a good
22 idea of where they're getting their goals that
23 they're setting and why they've chosen to go this
24 way or that.

1 MR. EDMOND: We have never meant to
2 leave the State out. The State's never been
3 forthcoming at the RAB meetings. They've always
4 sat in the background.

5 MS. HUGHES: We don't feel snubbed,
6 we're fine.

7 MR. EDMOND: Okay. Then if there's no
8 other comments or questions, we'll adjourn this
9 meeting to the 4th of March. Hope you have a nice
10 winter.

11	(Proceedings closed.)

CERTIFICATION

I, Loretta B. Devery, do hereby certify that the testimony and proceedings in the foregoing matter, taken on January 14, 1998, are contained fully and accurately in the stenographic notes taken by me and that it is a true and correct transcript of the same.

Loretta B. Devery
LORETTA B. DEVERY, RPR

The foregoing certification of this transcript does not apply to any reproduction of the same by any means unless under the direct control and/or supervision of the certifying reporter.
